11.0 Warranty

ELECTROMATIC Equipment Co., Inc. (ELECTROMATIC) warrants to the original purchaser that this product is of merchantable quality and conforms to kind and quality with the descriptions and specifications thereof. Product failure or malfunction arising out of any defect in workmanship or material in the product existing at the time of delivery thereof which manifests itself within one year from the sale of such product, shall be remedied by repair or replacement of such product, at ELECTROMATIC's option, except where unauthorized repair, disassembly, tampering, abuse or misapplication has taken place, as determined by ELECTROMATIC. All returns for warranty or non-warranty repairs and/or replacement must be authorized by ELECTROMATIC, in advance, with all repacking and shipping expenses to the address below to be borne by the purchaser.

THE FOREGOING WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE WARRANTY OF MERCHANTABILITY AND FITNESS FOR ANY PARTICULAR PURPOSE OR APPLICATION. ELECTROMATIC SHALL NOT BE RESPONSIBLE NOR LIABLE FOR ANY CONSEQUENTIAL DAMAGE, OF ANY KIND OR NATURE, RESULTING FROM THE USE OF SUPPLIED EQUIPMENT, WHETHER SUCH DAMAGE OCCURS OR IS DISCOVERED BEFORE, UPON OR AFTER REPLACEMENT OR REPAIR, AND WHETHER OR NOT SUCH DAMAGE IS CAUSED BY MANUFACTURER’S OR SUPPLIER’S NEGLIGENCE WITHIN ONE YEAR FROM INVOICE DATE.

Some State jurisdictions or States do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation may not apply to you. The duration of any implied warranty, including, without limitation, fitness for any particular purpose and merchantability with respect to this product, is limited to the duration of the foregoing warranty. Some states do not allow limitations on how long an implied warranty lasts but, notwithstanding, this warranty, in the absence of such limitations, shall extend for one year from the date of invoice.

ELECTROMATIC Equipment Co., Inc.

1.0 INTRODUCTION

DCF-3000EZ = For measurement on steel / iron
DCFN-3000EZ = For measurements on steel / iron and on non-ferrous metals

The Check•Line 3000EZ Series of coating thickness gauges provide accurate, non-destructive measurement of:

- All non-magnetic coatings, such as varnish, paint, enamel, chromium, copper, zinc, etc. on steel and iron. Measurements in the F mode (Ferrous) are carried out according to the Magnetic-Induction method.
- All electrically insulating coatings, such as varnish, paint, enamel on non-ferrous metals (aluminum, brass, stainless steel, etc.). Measurements in the N mode (Non-ferrous) are carried out according to the Eddy-Current method.

NOTE: 3000EZ Series gauges operate in accordance with the following international standards related to coating thickness measurement:

Magnetic Induction
- DIN EN ISO 2178, ASTM B499, DIN 50 982

Eddy-Current:
- DIN EN ISO 2360, ASTM D1400

10.0 ERROR MESSAGES

Error 1 = The probe is too close to the metal
Error 2 = Error of gauge due to the effect of electro-magnetic interference fields
Error 3 = The probe is defective

For Technical Assistance contact:

Electromatic Equipment Company

Telephone: 1-800-645-4330 (USA & Canada)

9.0 Measuring Limits

Minimum Radius for Convex Surfaces  0.2” (5mm)
Minimum Radius for Concave Surfaces  2” (50mm)
Minimum Headroom  4” (100mm)
Minimum Sample Diameter  0.5” (13mm)
Minimum Substrate Thickness - F  20 mils (0.5mm)
Minimum Substrate Thickness - NFe  2 mils (50 µm)
2.3 Complete Kit

3000EZ Series gauges are supplied as a complete kit, with gauge, plastic test shim, 2x AAA batteries, soft carrying pouch, manual and manufacturer’s calibration certificate.

DCF models include a steel zero plate. DCFN models include steel and aluminum zero plates.

3.0 Basic Operations

3.1 On/Off Switch

To turn the gauge on, press the ON/OFF Switch briefly (see photo on page 3). Press and hold the ON/OFF Switch for 2 seconds to turn the power off.

Note: The gauge will power off automatically after 90 seconds of non-use.

3.2 Selection of Measuring Units

1. Make sure the gauge is switched OFF.
2. Press and hold the ZERO and STATS keys simultaneously.
3. While continuing to hold down the ZERO and STATS keys, turn the power ON.

3.3 Manually setting the measuring mode

In some cases, especially with varnish applied to zinc on steel, it is advisable to manually set the measuring mode—F mode (Ferrous) for measurements on steel/iron, N mode (Non-ferrous) for measurements on non-ferrous metals.

Setting the measurement mode

1. Turn the gauge on by pressing the ON/OFF switch.
2. Press the ZERO and STATS keys simultaneously to change the measuring mode. Each time the keys are pressed the mode will change.

The display will show the mode selected (see photo, page 4) using the following abbreviations:
3.4 Total Reset to Factory Defaults

1. Switch the gauge off.
2. Press and hold the ZERO key. At the same time, turn on the power using the ON/OFF switch.
3. An acoustic signal will sound, all statistical values will deleted and the factory settings µm, calibration, and AUTO FN (DCFN-3000EZ only) will be activated.

3.5 Battery Replacement

3000EZ gauges use 2x AAA alkaline batteries. When battery power becomes low, the BATTERY INDICATOR will begin to flash. The gauge will continue to operate, but the batteries should be replaced as soon as possible. When battery power is depleted, the Battery Indicator will remain on continuously, indicating that less than 60 seconds of power remains before the gauge will shut off.

6.1 Clearing the statistical values:

To clear the statistical values, momentarily press and release the ON/OFF switch. A value of zero will be shown in the number or measurements field “n” confirming that the stored statistical values have been cleared.
4.0 Measuring Using Factory Calibration

1. Press the ON/OFF switch to turn the gauge on.

2. If the ZERO icon does not appear in the upper left corner of the display, the preset factory calibration is activated.

   If the ZERO icon does appear, it indicates that a Zero Procedure has been performed. See Clearing a Zero Setting, Section 5.2 before continuing.

3. Place the gauge on the test object and read the measurement. Lift the gauge off of the test object by at least 1 inch (2.5 cm) before taking another reading.

   Note: Using the factory calibration, you can immediately carry out measurements on flat and slightly curved surfaces. On strongly curved or rough parts it is recommended that a ZERO procedure be performed (see section 5.0).

DCFN-3000EZ Only: The DCFN-3000EZ automatically recognizes whether the base material is a ferromagnetic steel or a non-ferrous metal and will display the correct reading.

6.0 Online Statistics Display

Every time a measurement is taken, a pair of statistical values appear in the lower part of the display, as shown at right.

For example:

\[ n = 12 \quad \bar{x} = 2.8 \text{ mils} \]

\(n = \text{number of measurements} \); \(\bar{x} = \text{average}\)

Each time the STATS key is pressed, the number of measurements and a different statistical value will appear, allowing the user to easily scroll through statistics menu in the following sequence:

Press \(n = \text{number of measurements}\); \(\bar{x} = \text{average}\)
Press \(n = \text{number of measurements}\); \(s = \text{standard deviation}\)
Press \(n = \text{number of measurements}\); \(\text{max} = \text{maximum reading}\)
Press \(n = \text{number of measurements}\); \(\text{min} = \text{minimum reading}\)

You can pre-select a required pair of values by means of the STATS key, for example \(n = 12, s = 0.1 \text{ mils}\), and have it displayed during the entire measurement data recording process.

Note: After the statistical values are deleted, or before new measurements are made, the display will show:

\[ n = 0 \quad \bar{x} = \text{mils} \]

Important: If a series of measurements is meant to be statistically evaluated, the old statistical values must be deleted before starting a new series of measurements.

6.0 Online Statistics Display

Every time a measurement is taken, a pair of statistical values appear in the lower part of the display, as shown at right.

For example:

\[ n = 12 \quad \bar{x} = 2.8 \text{ mils} \]

\(n = \text{number of measurements} \); \(\bar{x} = \text{average}\)

Each time the STATS key is pressed, the number of measurements and a different statistical value will appear, allowing the user to easily scroll through statistics menu in the following sequence:

Press \(n = \text{number of measurements}\); \(\bar{x} = \text{average}\)
Press \(n = \text{number of measurements}\); \(s = \text{standard deviation}\)
Press \(n = \text{number of measurements}\); \(\text{max} = \text{maximum reading}\)
Press \(n = \text{number of measurements}\); \(\text{min} = \text{minimum reading}\)

You can pre-select a required pair of values by means of the STATS key, for example \(n = 12, s = 0.1 \text{ mils}\), and have it displayed during the entire measurement data recording process.

Note: After the statistical values are deleted, or before new measurements are made, the display will show:

\[ n = 0 \quad \bar{x} = \text{mils} \]

Important: If a series of measurements is meant to be statistically evaluated, the old statistical values must be deleted before starting a new series of measurements.
### 5.0 Performing a Zero Procedure

To obtain more accurate measurements on strongly curved or rough parts, you should carry out the ZERO Procedure on a similar curved reference piece without coating.

1. Press the ZERO key. ZERO flashes in the display.
2. Place the gauge on the bare surface several times. Lift the gauge off of the surface by at least 1 inch (2.5 cm) between placements.
3. Press ZERO key again. The display shows ZERO.
4. You can now carry out additional measurements.

**Note:** Zeroing is required if the convex radius of curvature
- is smaller than 1.2” (30mm) on steel parts,
- is smaller than 2.4” (60mm) on non-ferrous metal parts.

### 5.1 Checking Accuracy

The foil standard included in the complete kit can be used together with the supplied zero plates (Fe or Al) to check the accuracy of the gauge. After zeroing, the measured thickness of the foil will be displayed within the tolerance of the foil plus the gauge accuracy.

### 5.2 Clearing a Zero Setting and Restoring Factory Calibration

If the ZERO icon is shown on the display after switching on (see top photo below), a custom calibration is activated. To clear the custom setting:

1. Press the ZERO key twice. The ZERO icon disappears.
2. The factory calibration is active. You can now take measurements using the factory calibration.

---

### 5.0 Performing a Zero Procedure

To obtain more accurate measurements on strongly curved or rough parts, you should carry out the ZERO Procedure on a similar curved reference piece without coating.

1. Press the ZERO key. ZERO flashes in the display.
2. Place the gauge on the bare surface several times. Lift the gauge off of the surface by at least 1 inch (2.5 cm) between placements.
3. Press ZERO key again. The display shows ZERO.
4. You can now carry out additional measurements.

**Note:** Zeroing is required if the convex radius of curvature
- is smaller than 1.2” (30mm) on steel parts,
- is smaller than 2.4” (60mm) on non-ferrous metal parts.

### 5.1 Checking Accuracy

The foil standard included in the complete kit can be used together with the supplied zero plates (Fe or Al) to check the accuracy of the gauge. After zeroing, the measured thickness of the foil will be displayed within the tolerance of the foil plus the gauge accuracy.

### 5.2 Clearing a Zero Setting and Restoring Factory Calibration

If the ZERO icon is shown on the display after switching on (see top photo below), a custom calibration is activated. To clear the custom setting:

1. Press the ZERO key twice. The ZERO icon disappears.
2. The factory calibration is active. You can now take measurements using the factory calibration.
